Figure 1. Schematic representation of the experimental design. The subjects were divided into two groups: the control group (CG) and the experimental group (EG). The CG was divided into two subgroups: the control group (CG) and the experimental group (EG). The EG was divided into two subgroups: the control group (CG) and the experimental group (EG). The CG was divided into two subgroups: the control group (CG) and the experimental group (EG). The EG was divided into two subgroups: the control group (CG) and the experimental group (EG).

Abstract—The purpose of this study was to determine the effect of a 12-week training program on the heart rate (HR) and heart rate reserve (HRR) of sedentary middle-aged men. The subjects were randomly divided into two groups: a control group and an exercise group. The control group was instructed to maintain their current level of physical activity, while the exercise group was instructed to engage in a 12-week training program consisting of three sessions per week of moderate-intensity aerobic exercise. The HR and HRR were measured at rest and during maximal exercise at baseline and at the end of the 12-week training program. The results showed that the exercise group had a significant decrease in HR and HRR at rest and during maximal exercise compared to the control group. These findings suggest that a 12-week training program can improve cardiovascular fitness in sedentary middle-aged men.

Figure 1. The effect of the concentration of the H_2O_2 solution on the amount of the released H_2O from the H_2O_2 -loaded hydrogel. The amount of the released H_2O was measured by the weight difference of the hydrogel before and after the release. The concentration of the H_2O_2 solution was 0.1, 0.2, 0.3, 0.4, 0.5, 0.6, 0.7, 0.8, 0.9, and 1.0 wt. %.
